IDEATION PHASE

Brainstorm & Idea Prioritization Template

Date	_____
Project Name	Metro Ticket Generating System in ServiceNow
Maximum Marks	4 Marks

Purpose of Brainstorming

Brainstorming is used to identify the problem, explore possible solutions, and select the most suitable ideas for the Metro Ticket Generating System in ServiceNow. The focus is on improving the convenience and organization of metro ticket booking through a digital workflow. Ideas should be evaluated against the features actually supported by the completed implementation.

Project Overview

The Metro Ticket Generating System in ServiceNow is intended to support a digital metro-ticket booking process. The proposed workflow allows a user to provide journey information, process a booking request, and view the resulting ticket information according to the features implemented in the ServiceNow application.

Problem statement: Manual or fragmented ticket-booking steps can take time and may make it difficult to organize booking information. A digital workflow can help streamline request submission and keep booking details organized.

Step 1: Team Gathering, Collaboration and Select the Problem Statement

The first step is to define the user need and agree on the main problem the project should address. This project focuses on making metro ticket booking more convenient through a ServiceNow-based application and workflow.

Discussion area	Project finding
Target users	Passengers who need a straightforward way to submit metro journey and ticket requests.
Problem identified	Ticket booking can involve manual steps and scattered booking information.
Project goal	Create a digital workflow for entering journey details and processing ticket requests.
Platform selected	ServiceNow, using the application components configured for this project.

Selected Problem Statement

How can a ServiceNow-based application make the metro ticket booking process more convenient by organizing journey details and supporting a clear digital ticket-request workflow?

Step 2: Brainstorm, Idea Listing and Grouping

The following ideas are grouped by purpose. They represent the project's planning and design considerations; only features that are present and tested in the completed application should be described as implemented.

Idea group	Idea	Purpose / value
Booking input	Provide a form for journey details such as source and destination, where supported.	Collect booking information in a consistent format.
Request processing	Use ServiceNow workflow or configured automation to process submitted requests.	Reduce repetitive manual steps.
Fare information	Calculate or display fare based on configured rules, if implemented.	Help users understand the ticket cost.
Ticket information	Display or store the ticket/booking result.	Make booking details easier to review.
Communication	Send a booking notification if notifications are configured.	Keep the user informed of request status.
Future enhancement	Consider QR verification, cancellation, payment integration, or live route data as future work.	Identify possible extensions beyond the current implementation.

Proposed Workflow

1. Enter journey details
↓
2. Submit ticket request
↓
3. Process request using the configured ServiceNow application/workflow
↓
4. Review ticket or booking result

Note: Update this workflow if your actual implementation follows different steps. Add screenshots from the working application in the final project report or appendix if required by your college.

Step 3: Idea Prioritization

Ideas can be prioritized by considering usefulness to the user, feasibility in ServiceNow, and relevance to the core booking process. The priority below is a suggested planning order; it does not certify that each feature is already implemented.

Priority	Idea	Reason	Status to verify
1 — High	Journey details form	Core input required for a booking request.	Confirm in application
2 — High	Ticket request processing	Core workflow for handling submitted information.	Confirm in application
3 — Medium	Fare calculation/display	Useful for showing the cost of a journey.	Confirm in application
4 — Medium	Ticket result/record	Allows booking details to be reviewed.	Confirm in application
5 — Future	QR verification, payments, cancellation, live route data	Potential improvements that may require extra integrations.	Future enhancement unless built

Prioritization Criteria

Criterion	Question to consider
User value	Does the idea make booking clearer or more convenient?
Feasibility	Can it be built with the available ServiceNow features and permissions?
Core relevance	Is it necessary for the main ticket-request workflow?
Effort	Can it be completed and tested within the available time?

Conclusion

The brainstorming and prioritization exercise identifies the main need addressed by the Metro Ticket Generating System in ServiceNow and organizes potential solutions around booking input, request processing, fare information, and ticket results. The highest priority is to ensure that the core workflow works correctly and that the documentation accurately reflects the completed application.
