Metro Ticket Generating System in ServiceNow

Date	16 October 2026	**Project Name**	Metro Ticket Generating System in ServiceNow	**Maximum Marks**	2 Marks

Proposed Solution

The Metro Ticket Generating System in ServiceNow is proposed to simplify and organize metro ticket booking through a digital Service Portal. It brings ticket requests, fare calculation, approvals, ticket generation, notifications, and status tracking into one structured process.

Solution Overview

1. PROBLEM STATEMENT (PROBLEM TO BE SOLVED)

Metro passengers may face time-consuming ticket booking, unclear fare information, and difficulty tracking requests or cancellations. Manual follow-up can also make the booking process less convenient.

2. IDEA / SOLUTION DESCRIPTION

Build a ServiceNow Service Portal form to capture source and destination stations, travel date, ticket type, and passenger details. Use scripts to validate inputs and calculate fares, Flow Designer to route approvals, and automated notifications to deliver ticket details and updates.

3. NOVELTY / UNIQUENESS

The solution combines booking, fare calculation, approval routing, digital ticket generation, notifications, and status tracking within a single ServiceNow workflow. Fare summaries can update when ticket type or passenger quantity changes.

4. SOCIAL IMPACT / CUSTOMER SATISFACTION

A clearer online process can help commuters understand ticket options, reduce avoidable confusion, and follow the progress of requests. Role-based access also supports appropriate protection of passenger information.

5. BUSINESS MODEL (REVENUE MODEL)

The system supports metro ticketing operations rather than defining a separate revenue model. Ticket fares can follow the configured fare rules based on route distance or zones; the project requirements do not specify additional subscription or advertising revenue.

6. SCALABILITY OF THE SOLUTION

The ServiceNow platform structure separates the portal interface, application logic, workflow, and platform data. Station, route, and fare configuration can support multiple routes, subject to the capacity and configuration of the ServiceNow instance.

Expected Outcome

The proposed solution aims to provide a more consistent ticket-booking journey, accurate fare summaries, traceable approvals, digital ticket delivery, and convenient access to request status and cancellation handling.

Content is based on the uploaded Proposed Solution Template and the project requirements previously provided. Features or revenue streams not specified in those materials have not been presented as confirmed capabilities.
